

## **Colorado Breeders Depot Company Bio**

Abid Sattani, John Kalosinis, and Leo Sattani, are the proud Co-Owners of Colorado Breeders Depot, a hemp genetics company that hand selects the best phenotypes from their own farms, to offer their clients the highest quality, high CBD and CBG hemp strains. Their goal is to share their knowledge with the community, while providing the best CBD and CBG seeds and plants to help grow and maintain a top standard for hemp, in farms across the country.

“We are farmers ourselves, we want to help you grow and be successful. We don’t just provide the seed, but also our experience, and how to best farm and harvest your particular strain. We want farmers to keep a standard for this amazing crop that we believe will help change and heal many lives.” -Abid Sattani, Co-Owner of Colorado Breeders Depot

With an experienced background of growing cannabis for 25 years, the Colorado Breeders Depot team started testing and growing industrial hemp strains on their own farms five years ago in Yuma, Colorado. With a very minimal demand in hemp for fiber, they decided to turn their fields to high CBD hemp farms. Their genetics team instantly saw the potential of high CBD hemp, and decided to dedicate their resources toward helping other farmers benefit from this crop, as well. They knew they could introduce farmers to new opportunities since the hemp and CBD market recently gained momentum, thanks to the newly passed 2018 farm bill. After planting their genetics and receiving amazing results in 2018, they were prepared to help all farmers produce a successful hemp crop. They shared their expertise with growers from small greenhouses with ten clones all the way up to sprawling farms with thousands of acres. This was when the Colorado Breeders Depot vision started paving the path toward the multi-state operation it is today.

The Colorado Breeders Depot in-house genetics program puts a huge focus on tri-crop industrial hemp farming, using their feminized seeds. Tri-crop industrial hemp can be used for multiple applications, such as fiber, grain, or CBD. Industrial hemp has been used for these three applications, but, most hemp varieties are bred to produce only one of the three possibilities. Colorado Breeders Depot have breeding programs that have taken the time to develop and research triple-purpose varieties, in an effort to incorporate sustainability in the hemp industry.

Most recently, Colorado Breeders Depot expanded beyond their 24,000 sq. ft. facility, onto a 26,000 acre grow for one special strain in particular; Boax x Otto2. This industrial hemp strain that used to test with only 2% CBD, has been bred up to a whopping 12% CBD, thanks to the Colorado Breeders Depot breeding program. This is just one great example of the many versatile varieties that the team hopes to offer to farmers nationally. Colorado Breeder Depot prides itself in its lab tested, high quality CBD seeds. Their farmers use their farm seeds to provide tried and trusted results to all of their customers, which is clearly displayed on their website with Certificates of Analysis for each variety. They go the extra mile for their customers by helping farmers make connections with buyers through their online platform.

Colorado Breeders Depot is on a mission to make their mark on the hemp industry as pioneers of the tri-crop industrial hemp market. To see their varieties that are currently available, visit their website at [www.coloradobreedersdepot.com](http://www.coloradobreedersdepot.com) or, for more information, you can give them a call directly at 719-275-7770, email them at [info@coseedcbd.com](mailto:info@coseedcbd.com)
